401 series clocks and stopwatches with seven segment display characters

401A.02

front bezel: 144 x 72 x 3mm (5.7" x 2.8" x 0.125")
 case body: 132 x 58 x 147mm (5.2" x 2.3" x 5.8")
 display: 20 & 14mm (0.8" & 0.6")
 visibility: < 7m (20ft)

401A.057

case size: 390 x 90 x 58mm (15.4" x 3.5" x 2.3")
 display: 57mm (2.3")
 visibility: < 25m (75ft)

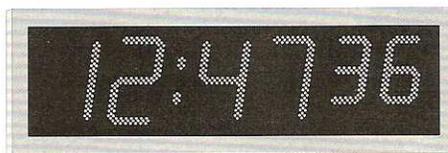

401A.100

case size: 670 x 180 x 58mm (26.4" x 7.1" x 2.3")
 display: 100mm (4")
 visibility: < 50m (150ft)

401A.170

case size: .S 990 x 260 x 58mm (40.0" x 10.2" x 2.3")
 case size: .SE 1070 x 320 x 100mm (42.1" x 12.6" x 3.9")
 display: 170mm (6.7")
 visibility: < 80m (250ft)

401A.220

case size: .S 1070 x 320 x 58mm (42.1" x 12.6" x 2.3")
 case size: .SE 1150 x 380 x 100mm (45.3" x 15.0" x 3.9")
 display: 220 & 170mm (8.7" & 6.7")
 visibility: < 100m (300ft)

401A.12

case size: 670 x 180 x 58mm (26.4" x 7.1" x 2.3")
 display: 120 & 100mm (4.7" & 4")
 visibility: < 50m (150ft)

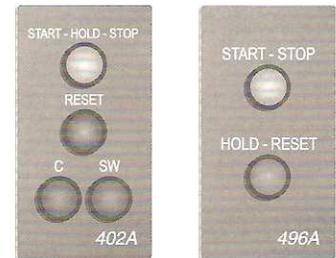

standard features
automatic & manual pre-set display brightness control
pre-programmed automatic seasonal time changes.
stand-alone or synchronised operation
alternating time & date display
accuracy - stand-alone operation: typically < than one second per week from 20-25 °C

optional features
stopwatch operation - requires 402A or 496a stopwatch controller - page 7
alternating time-temperature display - requires 406 temperature sensor - page 7
remote control by RS232 or RS485 level serial ASCII data commands

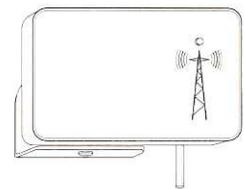

external synchronisation information	page 25
clock mounting information	page 26

standard time synchronisation options
Synchronisation by alternate and single polarity impulses, GPS and radio time codes, MB serial and MOBAline™ time codes. DCF or MSF radio time code or GPS satellite synchronisation requires the appropriate receiver, please refer to page 7 for further information
Control using w482® time code from a TimeLord series master clock to display time from one of fifteen different time zones

optional wBus® internal interface modules	order reference
to enable time synchronisation from EBU/SMTPE time codes	404.E
to enable time synchronisation from 1Khz modulated IRIG-B & afnor NFS 87 500 time codes	404.I
to enable one clock to act as a master to control up to ten 400A series clocks as slaves	404.M

402 & 496 stopwatch control units, 406 temperature sensor, 484 series radio time code receivers & 488 GPS time code receivers

	order reference
--	----------------------------

up/down stopwatch control	
The 402A up/down stopwatch control unit enables a 401A, 420A or 490A series clock to be used both as a multi-function stopwatch and as a time-of-day clock with the display freely switchable between time-of-day and stopwatch time. The time-of-day count may be synchronised to a number of external sources. The stopwatch function can be programmed to:	
<ul style="list-style-type: none"> · Count up from zero · Count down from a pre-programmed start-time to stop at zero · Count down from a pre-programmed start-time to zero, reset and restart from the pre-programmed start-time · Count down and then up through zero. 	
Flush mounting in a panel with rear access	402A
Hand held box with fixing to enable wall mounting	402A.S

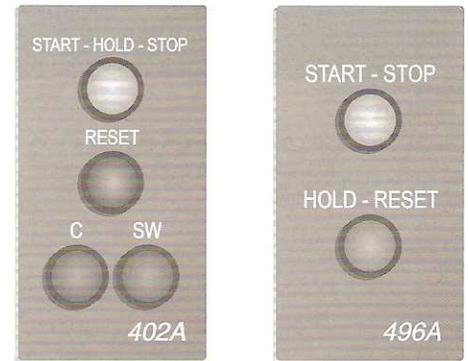

split action stopwatch control	
The 496A stopwatch control unit enables a 401A, 420A or 490A series clock to be used as a split action stopwatch	
Flush mounting in a panel with rear access	496A
Hand held box with fixing to enable wall mounting	496A.S

temperature sensor	
The 406 remote temperature sensor enables a 400A series clock or calendar clock to show an alternating display of time and temperature or static temperature display	
Wall mounting with 6m cable	406

radio time code receivers	
The 484.02 & 484.03 radio time code receivers are high performance units with dual crystal filters and dual ferrite elements to provide omni-directional capability. The cases are rated to IP65 and are suitable for protected external mounting	
60KHz Frequency for MSF reception	484.02
77.5KHz Frequency for DCF reception	484.03
The 484.06 & 484.07 radio time code receivers are low cost units with uni-directional antenna and rotating mounting brackets which are intended for internal use.	
60KHz Frequency for MSF reception	484.06
77.5KHz Frequency for DCF reception	484.07

GPS receiver systems	
GPS time synchronisation system. Comprising active antenna with post mounting, 8 channel receiver-decoder unit and interconnecting cable. Provides a synchronising signal for time zone displays and 400A series clocks either directly or via a TimeLord master clock. Requires 110v or 230v ac power supply.	488GPS
GPS time synchronisation system. Comprising active antenna with post mounting, 8 channel receiver-decoder unit and interconnecting cable. Provides a synchronising signal for a TimeLord source. Powered via TimeLord Source unit.	488BGPS

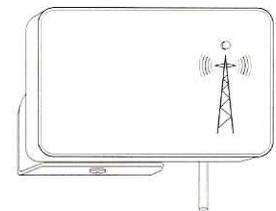

IR remote control for time zone displays	
The 408 infra-red remote control handset enables a 470, 471, 472, 473, 474, 475 or 479A time zone display, when used in stand-alone mode, to be programmed and synchronised with a local time reference.	408

402A & 496A
panel size: 54 x 102 x 27mm (2.1" x 4.0" x 1.1")

A **406** remote temperature sensor is required for an alternating time-temperature display

484.06 & 484.07
case size: 90 x 60 x 24mm (3.5" x 2.4" x 1.0")

484.02 & 484.03 (not shown)
case size: 160 x 80 x 55mm (6.3" x 3.1" x 2.2")

408 infra-red remote control handset

450 & 451 series multi-language calendar clocks

450A.05

case size: 550 x 90 x 58mm (21.6" x 3.5" x 2.3")
display: 50 & 30mm (2" & 1.2")
visibility: < 20m (60ft)

450A.12

case size: 1450 x 180 x 58mm (57.1" x 7.1" x 2.3")
display: 120 & 100mm (4.7" & 4")
visibility: < 50m (150ft)

451A.05

case size: 550 x 90 x 58mm (21.6" x 3.5" x 2.3")
display: 50 & 30mm (2" & 1.2")
visibility: < 20m (60ft)

451A.12

case size: 1450 x 180 x 58mm (57.1" x 7.1" x 2.3")
display: 120 & 100mm (4.7" & 4")
visibility: < 50m (150ft)

standard features

automatic & manual pre-set display brightness control
pre-programmed automatic seasonal time changes
stand-alone or synchronised operation
one, two or three alternating languages displayed from choice of 21
accuracy - stand-alone operation: typically < than one second per week from 20-25 °C

display: 100mm (4")
visibility: < 50m (150ft)

467A.05

case size: 460 x 90 x 58mm (18.1" x 3.5" x 2.3")
display: 50mm (2")
visibility: < 20m (60ft)

standard features

automatic & manual pre-set display brightness control
pre-programmed automatic seasonal time changes
stand-alone or synchronised operation
one, two or three alternating languages displayed from choice of 21
accuracy - stand-alone operation: typically < than one second per week from 20-25 °C

470A/2.05 -470A/7.05 time zone displays

470A/2.05 - 2 zones + calendar

case size: 525 x 390 x 58mm (20.7" x 15.4" x 2.3")

470A/3.05 - 3 zones + calendar

case size: 525 x 510 x 58mm (20.7" x 20.1" x 2.3")

470A/4.05 - 4 zones + calendar

case size: 525 x 630 x 58mm (20.7" x 24.8" x 2.3")

470A/5.05 - 5 zones + calendar

case size: 525 x 750 x 58mm (20.7" x 29.6" x 2.3")

470A/6.05 - 6 zones + calendar

case size: 525 x 870 x 58mm (20.7" x 34.3" x 2.3")

470A/7.05 - 7 zones + calendar

case size: 525 x 990 x 58mm (20.7" x 39.0" x 2.3")

display: 50mm (2")
visibility: < 25m (75ft)

The 470A/x.05 range of time zone displays are now available as 470AIL30 models with illuminated location legends on every zone.

Each time zone on the 470AIL30/x.05 has a 30mm high 10 character location legend display which can be user programmed to indicate a custom time zone name or location.

standard features

- customer specified choice of time zone locations and legend style
- pre-programmed automatic seasonal time changes
- stand-alone operation or central control via a TimeLord series master clock. (7 zone units must be controlled with a master clock)
- universal 100 - 250v 50/60hz ac power supply

The **TimeLord Atomic-locked Master Time Source** provides everything required for accurate timekeeping within a broadcast and professional AV environment. It solves the difficult problem of generating accurate video-referenced EBU and SMPTE timecode that can be used in the video domain, generating both LTC and VITC Longitudinal and Vertical interval timecodes with video character insertion.

EBU / SMPTE timecode outputs

Both balanced LTC Longitudinal Timecode and VITC Vertical Interval timecode are produced plus an on-board character generator allows accurate time / date video insertion with ident message if required. Up to 9 lines of 20 characters are possible with multiple ident messages, each of which may be individually positioned on the screen. These can be inserted together with time / timecode, date and use-bit information. The font size is also adjustable. There is a strict relationship between the time data within the timecode signal and the various 4-field and 8-field sequences in the video signal and unless timecode conforms to this relationship exactly, Broadcast servers and editing systems.

The TimeLord video input should be fed with a suitable reference signal, ideally station Black and Burst from the Master SPG Sync Pulse Generator. This signal is used to reference the generated EBU or SMPTE timecode outputs to the video signal, adjusting the timecode to meet EBU and SMPTE specifications.

software setup program is provided to download setup and ident message information to the TimeLord, including the selection of VITC lines which may also lie outside field blanking. This is particularly useful for modern VTRs which do not preserve the VBI Vertical Blanking Interval.

The **TimeLord** lets customers use their existing SPG sync pulse generator and yet provides accurate time-of-day timecode generated, locked to both an atomic reference and to video.

The PAL video signal follows an 8-field sequence (4-frames) whilst the NTSC sequence consists of 4-fields (2-frames) which then repeats. It is possible to deduce from the time bits in each timecode number, the type of video frame to which it refers (1,2,3,4 in PAL-SECAM / 1,2 in NTSC). Counting starts from frame 00:00:00:01 which is a video frame-1. The sync word in the timecode data must also occur within 1 bit of vertical sync - that is within 1/80th of a frame - so that one frame of timecode refers precisely to one frame of video.

When locked to an off-air reference such as GPS, the atomic clock provides absolute time information to the TimeLord. Unless the station SPG happens to be producing the correct frame of video at that time and that the vertical interval happens to line up with the sync word the timecode output has limited use for video applications. Station automation systems and editing controllers are often upset by discontinuities and ambiguities in timecode data which is why correct video locking is essential.

SMPTE/EBU outputs

There are of course ways to lock the SPG oscillator to the same time / frequency source (GPS for example) and Vortex has high stability disciplined oscillators available for this if required. These include very long phase-locked loops to ensure that no jitter from the off-air signal is passed onto the SPG video output as can occur in some cases. Even with an externally-locked oscillator, however, the relationship between the vertical interval and timecode is unlikely to be correct and a discontinuity will still occur if there happens to be "leap second" which introduces a 1-second jump in time which does not correspond to a whole number of video frames.

How the TimeLord works

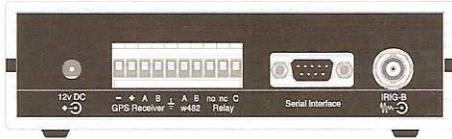

The TimeLord always generates EBU/SMPTE timecode locked to reference video. The time information from the atomic source is adjusted to the nearest correct value to ensure that the timecode output matches the SPG reference. The timecode output, which is referenced to external video, will drift compared to the off-air reference over time. Once this becomes more than 3 frames the TimeLord recognizes the offset and allows the timecode output to re-synchronize to the atomic reference but at a pre-determined time - 3am for example - downloaded to the TimeLord from using setup program. Of course, daylight savings changes occur immediately. If the SPG happens to be locked to the same off-air reference (eg GPS), this drift will not occur and the TimeLord will not have to re-adjust the timecode output except when leap seconds occur. Even with a free-running broadcast Master SPG such as the Vortex SPG-100SP or SPG-100XP which have ovened oscillators, this drift will be very slow and resynchronization will only need to occur after a number of days or even weeks.

TimeLord-MTG rack mounting
master clock

TimeLord T series table top or free standing master clock

TimeLord R series rack mounting master clock

The TimeLord-lite/T desktop master clock provides a complete precision time synchronisation solution for computer networks, CCTV security, C³, digital clock systems, industrial process control, voice recording and many other applications requiring accurate time synchronisation of equipment.

The following data outputs are provided as standard:

RS232 and RS422/RS485 outputs which can transmit one of more than 36 different serial ASCII time and date telegrams at user selected formats and intervals. A wide range of application specific time and date message formats, with pre-programmed parameters where applicable, provide a simple 'set and forget' capability to enable the precision synchronisation of many different types of video recording, computer and communications equipment.

An RS232 level precision 1pps 'on-time' signal.

A programmable changeover relay contact pair providing periodic signals or status information.

A w482® time code output which can control up to fifty 400A series digital clocks or time zone displays showing time and date in up to 15 different world-wide time zones with pre-programmed seasonal time changes.

An optional 600Ω, 1Khz modulated multi-format IRIG code output or an EBU time code output may be specified at time of order.

The TimeLord-lite/T master clock may be used in stand-alone mode, deriving its time keeping from its accurate, high stability, internal crystal oscillator or, for ultimate precision, synchronised via optional receivers to GPS satellite transmitters or DCF and MSF terrestrial radio time code transmitters.

The TimeLord T master clock is housed in a small free standing case and is also available as the TimeLord R model housed in a 1U high case and suitable for 19" rack mounting applications.

software

The TimeLord Time Source is supplied with **Free** Win NT4 (x86) and Win 9x synchronisation software and has a serial output format compatible with the standard NTP distribution. (www.ntp.org)

power supply

.T. versions are supplied with an external 'plug-top' type power supply unit.

.R. versions, housed in 19" rack mounting cases are fitted with an internal 100-250v 50/60Hz ac power supply.

Both versions may also be powered from an existing 12v dc 200mA power source.

The required operating voltage and connector type must be specified by placing the appropriate country code at the end the the part number in place of .psu

- .AU - Australian style, 240v 50Hz ac.
- .EU - European style, 230v 50Hz ac.
- .UK - UK style, 230v 50Hz ac.
- .US - US style, 110v 60Hz ac

TimeLord-lite rack mount master clocks provide a complete time reference solution for both simple and complex systems with outputs compatible with computer networks, CCTV security systems, process control, voice recording and C³ in addition to the traditional role of controlling slave clocks.

The following data outputs are provided as standard:

The TimeLord-net master clock is fitted with a 10Base-T Ethernet interface to allow it to act as a NTP time server on a TCP/IP network (TimeLord-net only.)

A single RS232 and RS422/RS485 output which can transmit one of more than 36 different serial ASCII time and date telegrams at user selected formats and intervals. A wide range of application specific time and date message formats, with pre-programmed parameters, provide a simple 'set and forget' capability to enable the precision synchronisation of many different types of video recording, computer and communications equipment. Up to three additional multi-format serial outputs are available as an extra cost option.

An RS232 level precision 1pps 'on-time' signal.

A programmable changeover relay contact pair providing periodic signals or status information.

A w482@ time code output which can control up to fifty 400A series digital clocks or time zone displays showing time and date in up to 15 different world-wide time zones with pre-programmed seasonal time changes.

An optional 600Ω, 1Khz modulated multi-format IRIG code output or an EBU time code output may be specified at time of order.

The TimeLord-net master clock may be used in stand-alone mode, deriving its time keeping from its temperature compensated internal crystal oscillator (TCXO) or, for ultimate precision, synchronised via optional receivers to GPS satellite transmitters or DCF and MSF terrestrial radio time code transmitters.

The TimeLord-net master clock is housed in a 1U high case and suitable for free standing or 19" rack mounting applications.

TimeLord rack mounting master clock

supported protocols

TimeLord-net supports the following protocols via its 10Base-T Ethernet interface:

NTP and SNTP - Network Time Protocol (NTP) v2, v3 and v4 clients are supported in both unicast and broadcast modes of operation (RFC1305 & RFC1119)

Simple Network Time Protocol (SNTP) v3 and v4 clients are supported in both unicast and broadcast modes of operation (RFC2030 & RFC1769)

TIME protocol (RFC868) is supported in UDP mode

SNMP - Simple Network Management Protocol is supported allowing remote management of the 4860net master clock. (available during 2002)

software

The TimeLord-net is supplied with a 25 user licence for Win NT4 (x86) and Win 9x time synchronisation software

Basic TimeLord units are supplied with serial time synchronisation software to synchronise a single Win NT4 (x86) and Win 9x pc

power supply

Universal 100-250v 50/60Hz ac power supply. The required operating voltage and connector type must be specified by placing the appropriate country code at the end the the part number in place of .psu

- .AU - Australian style, 240v 50Hz ac.
- .EU - European style, 230v 50Hz ac.
- .UK - UK style, 230v 50Hz ac.
- .US - US style, 110v 60Hz ac

601 & 610 frequency control clock systems

601.057

case size: 1470 x 130 x 58mm (57.9" x 5.1" x 2.3")
visibility: < 25m (75ft)

601.100

case size: 2600 x 230 x 58mm (102.4" x 9.1" x 2.3")
visibility: < 50m (150ft)

610.02

case size: 240 x 130 x 58mm (9.5" x 5.1" x 2.3")
visibility: < 10m (30ft)

The 601 and 610 frequency control clock systems are designed to provide an integrated display of time and frequency information for power generation control rooms and facilities.

Each display unit uses bright red, green, yellow or blue LED characters to provide an accurate read-out of the supply Frequency, the Standard Time derived from the internal or external time reference, the Frequency Time derived from the 50 or 60Hz supply frequency and the Time Difference between the Standard Time and the Frequency Time.

The display of Frequency and the Frequency Time count are derived from a dedicated, isolated voltage input. The Frequency display has an accuracy of:

$$\pm 0.001\% \pm 1 \text{ digit from } 20\text{-}80\text{Hz}$$

Both units have an internal, temperature compensated, quartz crystal oscillator that provide a typical initial accuracy of better than 0.1 seconds per day.

An optional 488BGPS satellite time synchronisation sub-system may be fitted to maintain the time keeping within 1mS of UTC.

Each unit can also be synchronised to the w482 code output of a TimeLord series master clock or to MOBALine time code. IRIG-B or afnor NFS 827 500 time synchronisation is also available as an extra cost option.

A serial RS232 + RS485 data port is provided which allows the master/slave operation of multiple units or the display of information derived by a remote intelligent time /frequency computer with an appropriate serial data output.

Units are fitted with a universal 100-250v 50/60Hz power supply and may also be supplied, at additional cost, for operation from a 24 or 48v dc supply.

External Synchronisation

400A series clocks may be synchronised from a range of sources, including radio and satellite time signals and various time codes and impulse signals.

Please note that every externally synchronised 400A clock requires a power supply connection in addition to the data connection.

Alternate and Single Polarity Impulses

Conventional analogue slave clocks are usually controlled by a master clock by means of 24v alternate polarity impulses. The impulses may be transmitted every second, half minute or minute. Impulses are either stopped or increased in rate to effect seasonal or other time corrections. The slave clocks are connected in parallel across the signal cable from the master clock. 400A clocks may be synchronised by 1sec., ½ min. or 1min. 6-48v single or alternate polarity impulses.

Time code synchronisation

The principle advantage of using a time code rather than an impulse signal for synchronising slave clocks is that the use of time code enables a self-setting of the clock on installation, following failures of the mains power supply and in the event of system maintenance. Seasonal time changes normally take place within a few seconds, rather than at the delayed rate typical of an impulse system. The slave clocks will not, in normal circumstances, show an incorrect time.

w482® timecode

The w482® signal was developed for controlling electronic clocks, providing time and date information in any of fifteen different synchronised time zones, using a single cable pair parallel data interconnection, in electrically noisy environments. principal advantage of w482® time code is the ability to provide time information in any one of fifteen different synchronised time zones.

The w482® signal is transmitted at 4-24v amplitude at a 50bps data rate. Typically up to 50 slave clocks can be controlled by a single unbuffered TimeLord master clock output at a distances of over 1km.

A 400A series clock, fitted with a 404.M local master module, may be used as a master clock in a small clock system. Up to ten other 400A series clocks may be controlled as slaves, displaying time, or date and time, in a single time zone at distances of up to 200m.

EBU/SMPTE time code

EBU/SMPTE time code is used in broadcast applications for 'stamping' time information on recordings and for the control of clocks and other intelligent systems. The EBU standard defines the format for hours, minutes and seconds information. Date information can be added to the signal in a number of formats within 'user bit' areas. 400A series clocks, fitted with the 404.E internal interface module, may be programmed to decode the two most popular date formats for either EBU or SMPTE code transmitted within $\pm 20\%$ of the standard speed.

IRIG-B/AFNOR NFS 87 500

IRIG-B is one of a series of time codes originally developed in the 1940s by the International Range Instrumentation Group (IRIG) for recording time information on magnetic tape and wire for rocket test range instrumentation purposes.

AFNOR NFS 87 500 time code is a development of IRIG-B that is widely used in Europe and contains additional date information. All 400A clocks and calendar clocks, when fitted with the optional 404.I internal interface module, may be synchronised with either a 1KHz amplitude modulated IRIG-B or AFNOR NFS 87 500 time code.

MOBAline®

MOBAline® is a two-wire data transmission system designed for low-speed, highly reliable data transmission and slave equipment control using a frequency modulated 50Hz sine wave signal.

MOBAline® is a registered trade mark of MOSER-BAER AG, wBus® and w482® are registered trade marks

Radio Time Code Synchronisation

All 400A series clocks can be programmed to synchronise to radio time code signals from DCF or MSF when connected to the appropriate 484 series receiver. The clock may be programmed to display BST (MSF synchronised), CET (DCF synchronised) or UTC (GMT) from either MSF or DCF

The DCF signal is transmitted at 77.5KHz and is derived from an atomic clock at the Physics Institute of Brunswick. The MSF signal is transmitted at 60KHz and is referenced to the Caesium Beam Oscillators at the National Physical Laboratory.

Under normal circumstances the DCF signal provides reliable operation at distances of up to 1500km. MSF signals are normally usable up to 1000km. Greater operating ranges are possible at night. However, both signals are subject to increasing levels of electrical noise from computers, communications systems and other type of electronic equipment particularly in urban areas and reception cannot be guaranteed even within the normal operating area.

The received and decoded signal has an operating accuracy of better than $\pm 20\text{mS}$ and provides completely automatic seasonal time changes. During periods of signal failure or signal corruption the clock will maintain accurate time keeping using its internal high stability quartz crystal oscillator.

The signal output from a 484 series receiver may be used to synchronise a master clock system or directly control a 400A series clock. Up to ten further 400A series clocks may be controlled by the clock to which the 484 series receiver is connected using a simple single cable pair interconnection. The first clock should be fitted with a 404.M local master wBus interface module.

GPS Satellite Time Synchronisation

400A series clocks, when used with the 488GPS time synchronisation subsystem, can be synchronised to the time signals from the 21 satellites forming the GPS navigation network. The GPS satellites transmit highly accurate, real time, world-wide navigation information at a frequency of 1575.42MHz.

The 488GPS & 488BGPS time synchronisation subsystems comprise an active antenna, receiver/decoder unit and interconnecting cables. The receiver decoder unit provides a UTC based w482® time code output which can be used to synchronise a master clock system or up to ten individual 400A series clocks. 400A series clocks and calendar clocks synchronised by GPS signals are accurate to within $\pm 5\text{mS}$ at any point on the surface of the earth. The 488GPS system is designed for simple installation and operation.

Please request a 488GPS system data sheet for further information.

NTP Ethernet time synchronisation

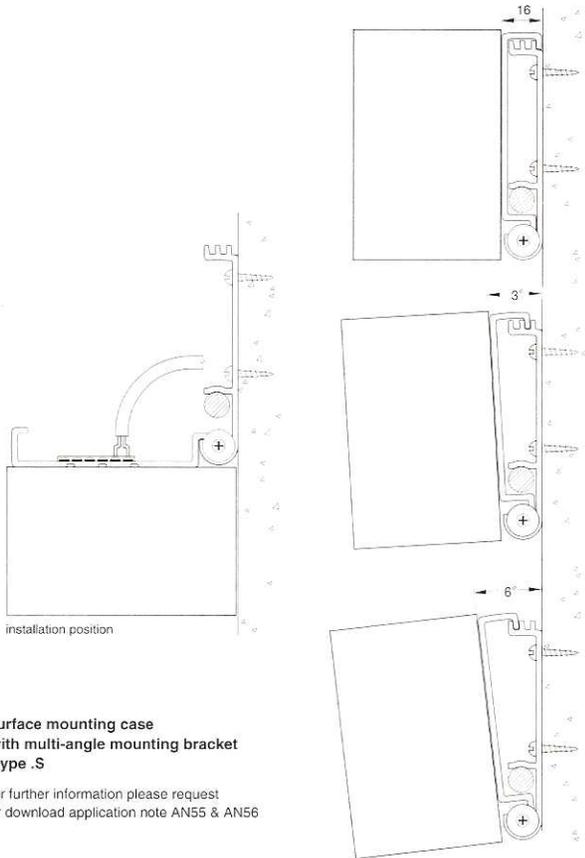

The need for precision time synchronisation across computer networks is becoming ever more widespread for applications which include authentication systems, cryptographic systems, billing and reservation systems, data collection, financial markets and multiple user shared file systems.

The Network Time Protocol (NTP), developed by researchers at the University of Delaware, is designed to provide time synchronisation to groups of computers across a LAN, WAN or even Internet environments.

NTP uses the UDP protocol to communicate between clients and servers. The client requests the time from the server at regular intervals, calculates the round trip delay correction and controls its own internal clock accordingly.

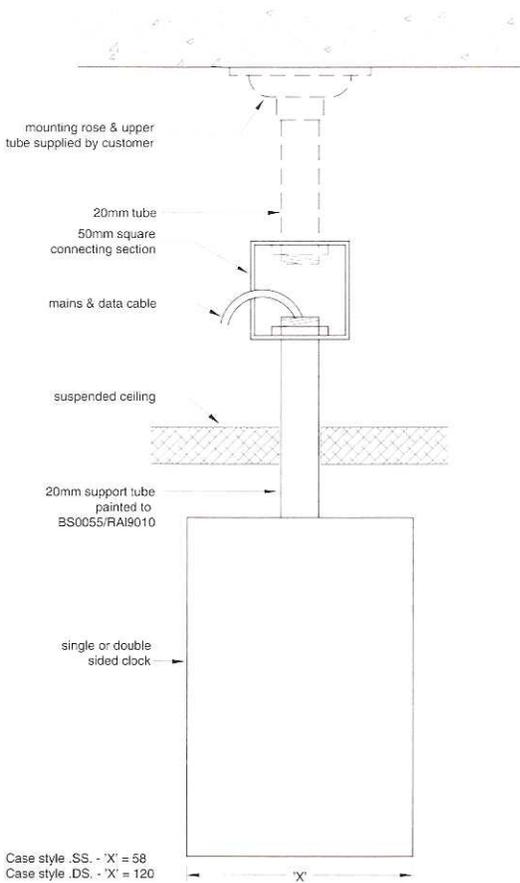

Most internal computer clocks do not provide sufficient accuracy or traceable time synchronisation for such mission critical applications and the TimeLord-net time server provides a cost effective external time reference solution for most applications.

clock mounting information

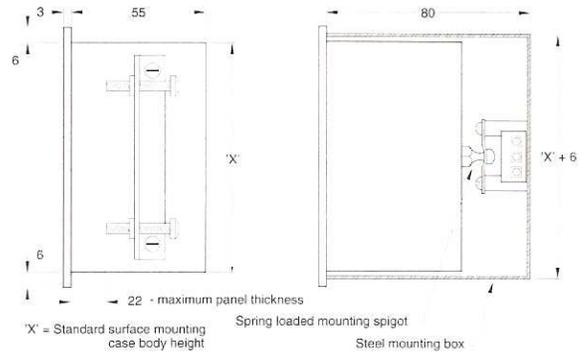

surface mounting case with multi-angle mounting bracket - type .S

for further information please request or download application note AN55 & AN56

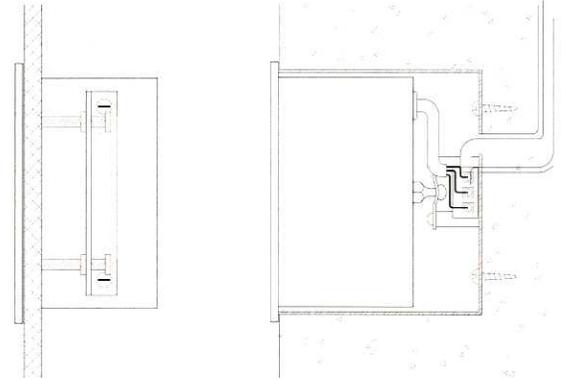

Case style .SS - 'X' = 58
Case style .DS - 'X' = 120

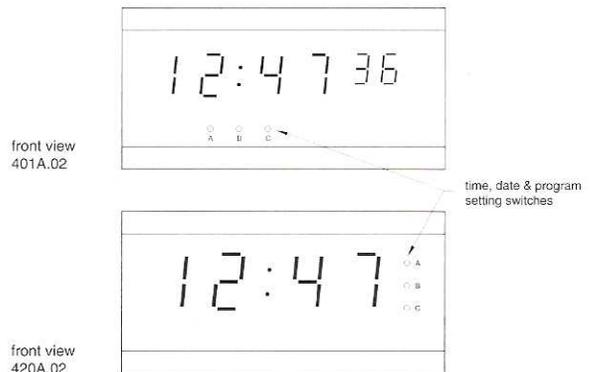

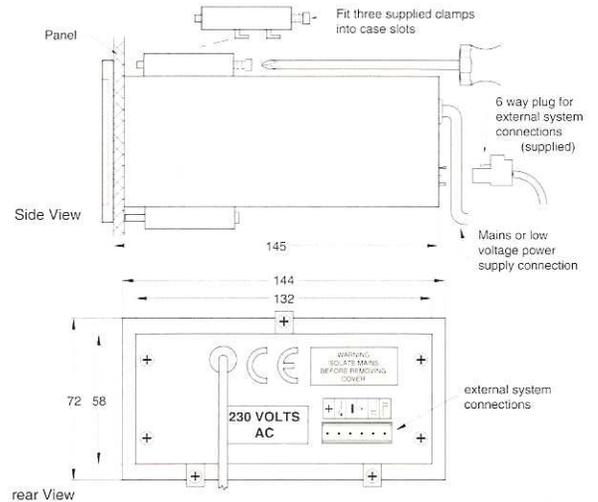

single & double sided ceiling suspended cases - type .SS & .DS
for further information please request or download application note AN52

'X' = Standard surface mounting case body height
Spring loaded mounting spigot
Steel mounting box

flush fitting case for mounting in a panel - type .FP
flush fitting case with mounting box for mounting in a solid wall - type .FB
for further information please request or download application note AN53 & AN54

401A.02 & 420A.02 flush mounting clocks for control panels - type .FP
for further information please request or download application note AN53
